

Evaluation of Sensor Based Residential Irrigation Water Application

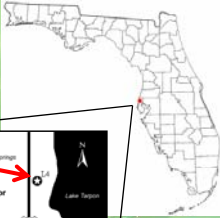

Melissa B. Haley
Agricultural & Biological Engineering

Michael D. Dukes
Agricultural & Biological Engineering

Experimental Design

- Residential Cooperators
 - Palm Harbor Florida
 - Historical water use
 - Landscape level

Experimental Design

All homes have the following

Automatic in-ground irrigation

Water and irrigation meters

Automatic meter recording device

Experimental Treatments

Homes are subdivided into 4 groupings

1. Monitoring only.....

2. Current irrigation system plus rain sensor (6 mm).....

+

3. Current irrigation system plus rain sensor and educational materials.....

+

+

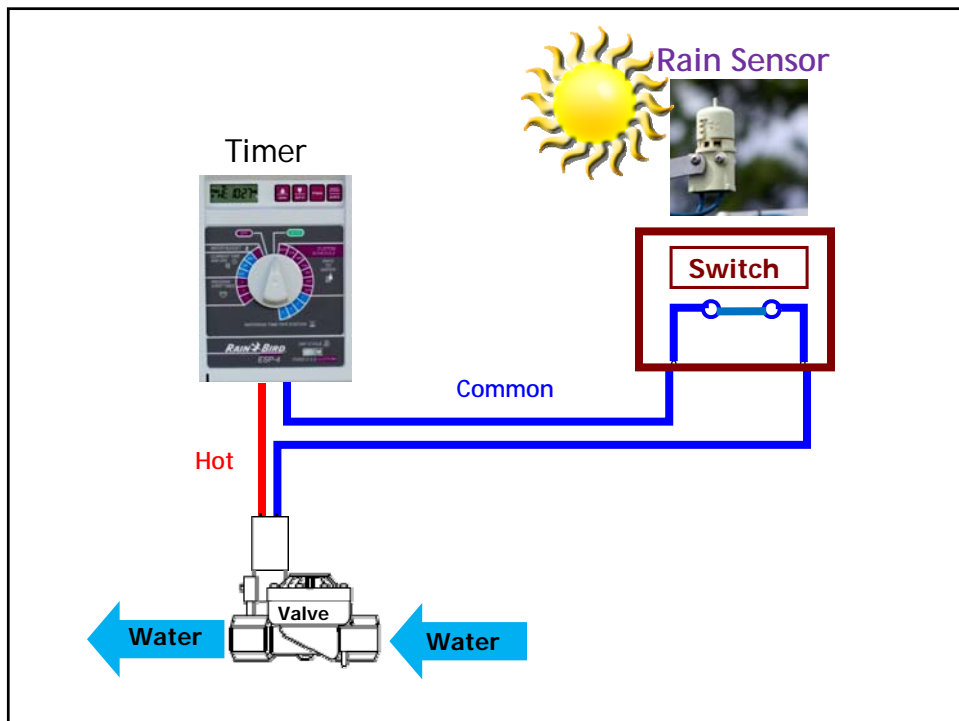

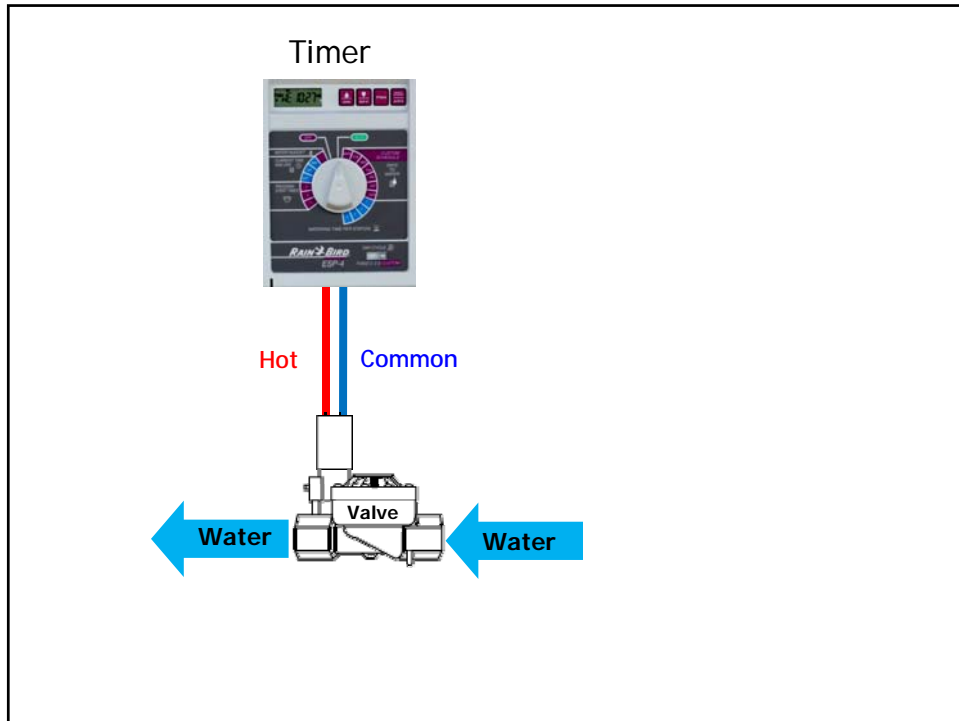

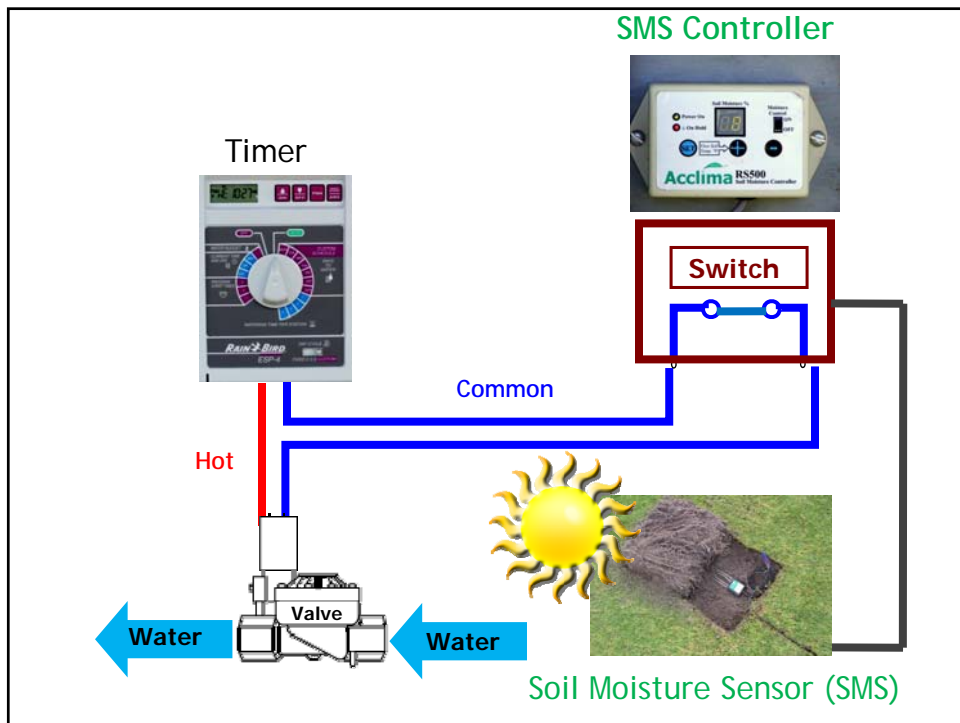

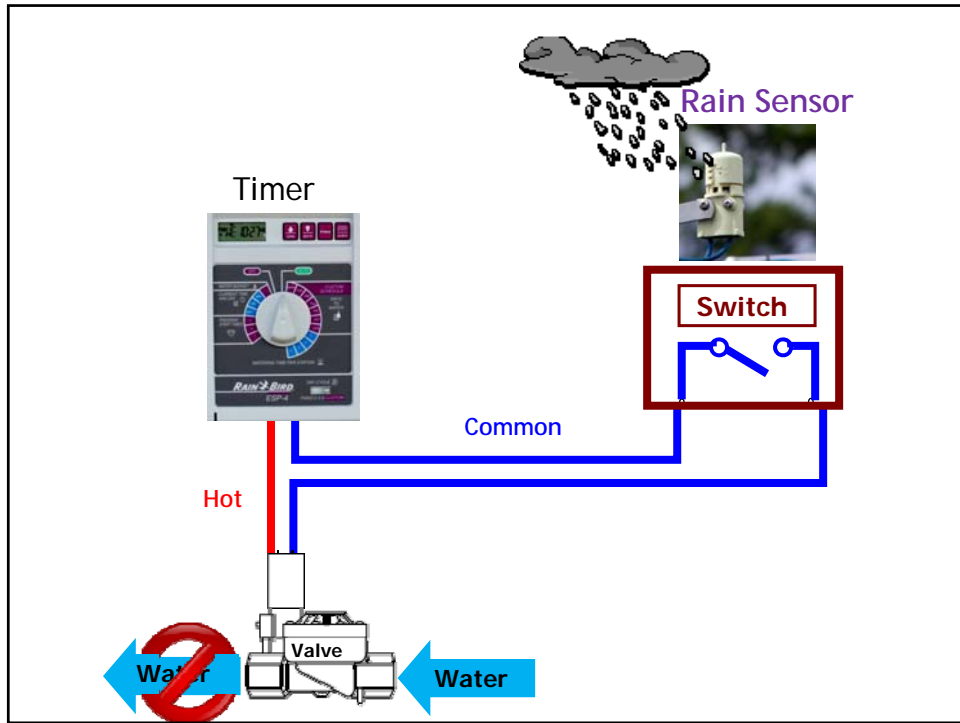

4. Current irrigation system plus a soil moisture sensor.....

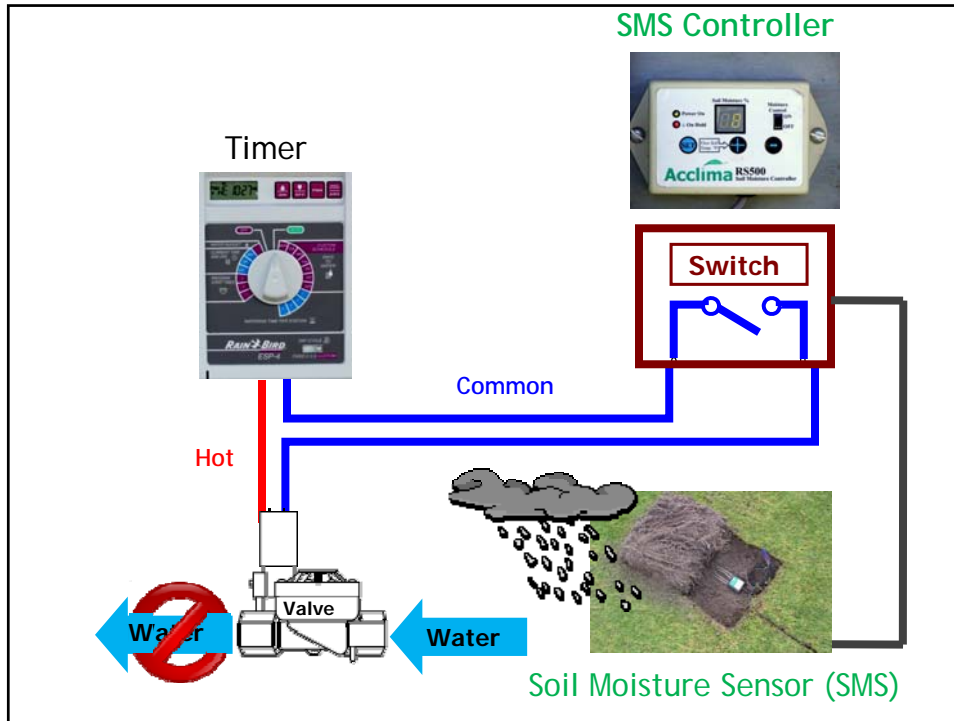

+

The System Rain Sensor

The rain sensor is set to bypass the irrigation system if there has been greater than ¼ inch of rainfall. If the sensor bypasses the system, your turfgrass will NOT suffer. Additional irrigation will not be absorbed into the root zone at this time. Irrigation is not necessary if the rain sensor is activated. You do not need to turn off your controller; it will automatically bypass the signal sent from the controller to the irrigation valves.

The Irrigation Flow Meter

You may have noticed the new meter installed. This meter measures the amount of water used by the irrigation system only. The utility water meter measures the total water use from your home, both inside and outside use. This meter will be read monthly by an employee of Pinellas County Utilities, it will not affect your water bill. You are welcome to read it yourself as well.

Irrigation Runtimes in Minutes

Use the following table to set your irrigation system for seasonal water use. The zone runtimes have been calculated for your system based on once day per week irrigation. These are guidelines and set to help you conserve water, you can water more or less if you notice inadequate water application in the landscape. Please call the University with any major changes to the suggested runtimes so we may update our records or your water practices.

Season	Zone 1	Zone 2	Zone 3	Zone 4	Zone 5	Zone 6
Winter (Dec., Jan., Feb.)						
Spring (Mar., Apr.)						
Summer (May, Jun, Jul, Aug.)						
Fall (Sep., Oct., Nov.)						

Your Zone Locations and sprinkler types:

Zone 1 – Micro-irrigation by house.	Zone 4 – Sidewalk strip, spray heads.
Zone 2 – Left side, mostly rotor heads.	Zone 5 – Front micro-irrigation.
Zone 3 – Right side, rotor heads.	Zone 6 – Back yard, spray heads.

Questions or Concerns

For irrigation or project related inquiries:
 Melissa Haley
 at the University of Florida

Turf Quality

- Turf Quality ratings based on NTEP procedures (1-9 scale)
 - 1 dead turf
 - 5 minimally acceptable turf quality
 - 9 perfect density and color

Observed monthly precipitation (avg. of four weather stations) for the treatment period compared to historic monthly mean precipitation (St. Petersburg, FL)

Estimated water use statistics two years prior to the study beginning, used for treatment determination.

Quartile	Estimated Irrigation Water Application Depth (in/30d)			Estimated Irrigation Water Volume Usage (gal/30d)		
	Average	Min.	Max.	Average	Min.	Max.
Low	1.2	0.8	1.4	5,029	1,875	9,000
Medium	2.4	1.6	3.4	9,999	4,281	17,063
High	5.3	3.6	8.4	19,517	6,719	33,000

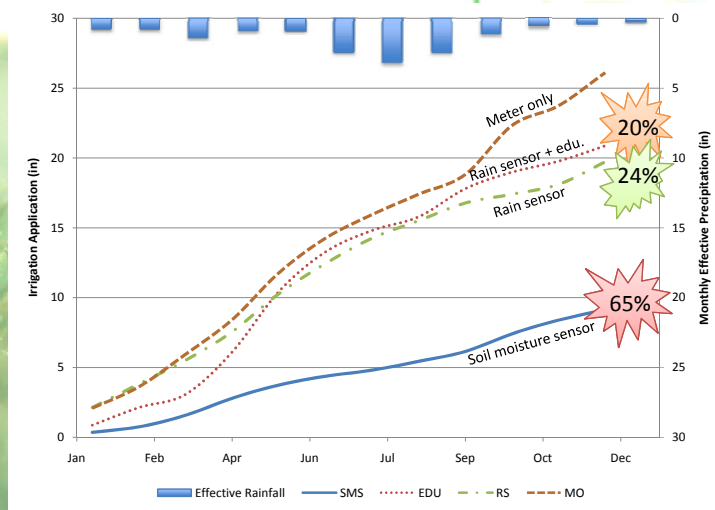

Distribution Uniformity of Cooperating Homes

Results from treatment designation through Dec '09

Results for 2008 only

Automatic Meter Recorded Data

- Data-loggers installed at all homes
 - Attached to existing water meter
 - Installation in May 2007
 - Water use data collection interval
 - Initially 10 minute
 - Now collecting hourly

Average Number of Irrigation Events per Month

		Number of Irrigation Events							
		I _{actual} ^Z (# ^S /mth)	N ^Y (#)	Max (#/mth)	Min (#/mth)	Std Dev (#/month)	CV (%)	I _{calc} ^T (#/month)	
Treatment ^R	SMS	2.1c ^Q	185	11	0	2.8	136		
	RS	4.7a	195	22	0	5.6	114	4	
	MO	5.2a	173	29	0	6.5	125		
	EDU	3.6b	187	20	0	4.1	113		
Season ^P by Year	2007	Spring	— ^N	—	—	—	—	—	
		Summer	2.1	32	21	0	4.3	210	5
		Fall	4.5	81	29	0	6.7	153	4
		Winter	4.1	46	21	0	4.9	137	2
	2008	Spring	5.6a	144	29	0	5.6	109	7
		Summer	4.1b	138	26	0	5.0	135	3
		Fall	2.8c	117	20	0	3.6	143	5
		Winter	3.5bc	138	29	0	4.7 ^O	151	2

Note: Uppercase superscript letters indicate footnotes.

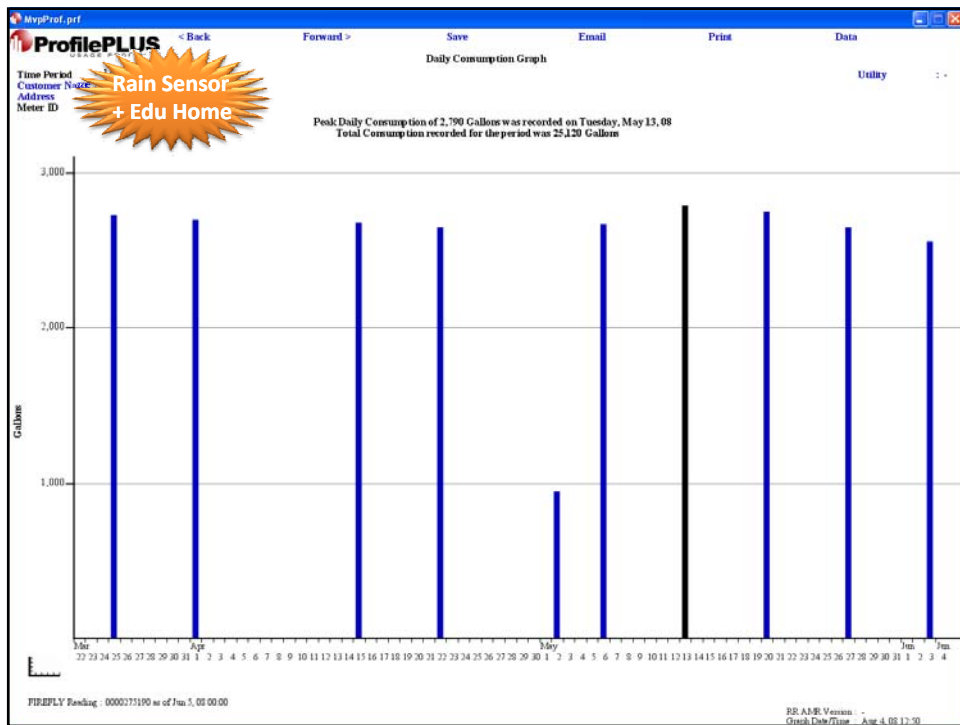

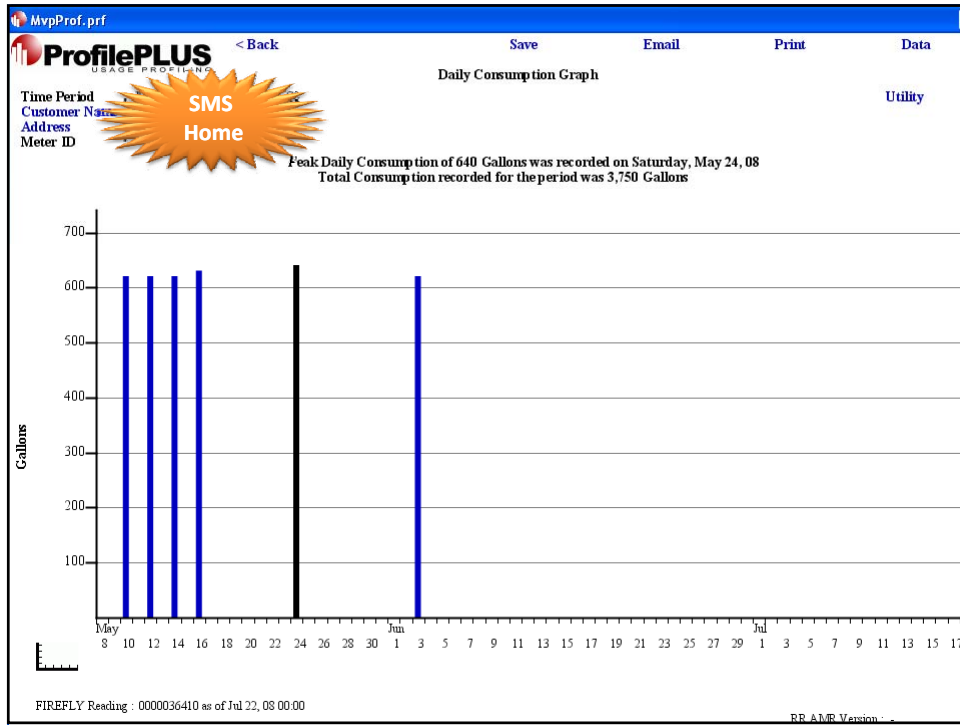

^Z Monthly average number of irrigation events applied.

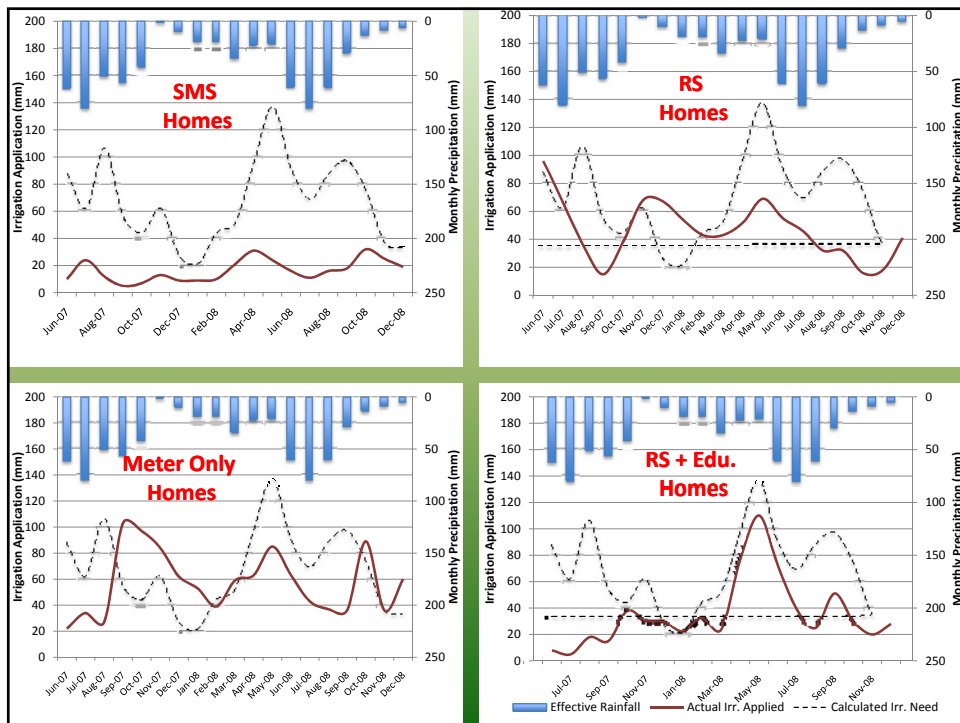

^Y N = number of observations in the comparison.

^T Number of irrigation events per month, calculated from the SWB.

^S Conversion: 1 inch = 25.4 mm

^R Treatments are: SMS, time-based controller plus soil moisture sensor system; RS, time-based controller plus rain sensor; MO, time-based controller only; EDU, time-based controller plus rain sensor and educational

Summary

- The soil moisture sensor group
 - has statistically the lowest cumulative and mean irrigation application
 - least number of weekly irrigation events
- By inspection of the frequency of the irrigation events for each treatment (from AMR data)
 - the soil moisture sensor effectively bypasses irrigation events
 - this is the only treatment in which the range of monthly irrigation events is successfully governed

Next Household Phase Lessons Learned
